A Survey of Stone Fruit Clones in the United States

U. S. DEPT. OF AGRICULTURE
NATIONAL AGRICULTURAL LIBRARY
AUG 3 1 1964
CURRENT SERIAL RECORDS

Agricultural Research Service
U.S. DEPARTMENT OF AGRICULTURE

PREFACE

This publication is the second of a series of surveys to determine clonal stocks of fruit and nut crops currently being maintained by Federal and State Stations. The first survey covering apples was published May 24, 1963 and the third, Pears, Nuts and Other Fruits, is under preparation.

This survey was conducted at the request of the National Coordinating Committee on New Crops. Its purpose is to obtain an indication of the volume of material that would be involved in establishing clonal germ plasm repositories for the use of fruit breeders throughout the country.

ACKNOWLEDGMENT

Gratitude is expressed for the assistance of H. F. Winters of the New Crops Research Branch, Crops Research Division, Agricultural Research Service, under whose direction the questionnaire was designed and initial distribution made. The author also acknowledges the work of D. D. Dolan, W. R. Langford, W. H. Skrdla, and L. A. Mullen, coordinators of the New Crops Regional Cooperative Program, through whom the data used in this survey were obtained from the State Experiment stations. Finally, it is recognized that much extracurricular work was expended by the various experiment stations in completing the questionnaires.

A SURVEY OF STONE FRUIT CLONES IN THE UNITED STATES

H. H. Fisher
Crops Research Division
Agricultural Research Service
United States Department of Agriculture

INTRODUCTION

The necessity of perpetuating species, strains, and cultivars of plants for use by research workers in agriculture and related fields has long been recognized. Much has been written on the subject, but the responsibility for the maintenance of such plant stocks rested upon the Federal plant introduction stations and those State and private institutions interested in specific items. Loss of interest in given groups of plants or attrition of funds and personnel has often resulted in a loss of specific items making them no longer available to the free world. The value of germ plasm thus lost will never be known.

An approach to the problem of preserving germ plasm for future use was considered by the National Research Council in 1944. After due consideration of the Council's recommendation, the Congress wrote a provision into the Research and Marketing Act of 1946 that the U.S. Department of Agriculture set up a National Program for the--preservation of new and useful plants of potential value--and for the preservation of valuable germ plasm.

The National Coordinating Committee for New Crops appointed a subcommittee to make surveys to determine how best to preserve germ plasm in seed form. As a result, the National Seed Storage Laboratory was established at Fort Collins, Colorado, in October 1958 by the U.S. Department of Agriculture.

The maintenance of germ plasm as seeds only partly solves the problem. Germ plasm of asexually propagated plant materials presents a more costly and complex proposition. Repositories in several locations to accommodate the climatic requirements of the various types of plants would be necessary. Sanitation and cultivation would also vary with the material involved. A technical staff would be needed to determine the best means of perpetuating the clones and keeping abreast with other problems that would arise.

As an approach to the second phase of the germ plasm storage problem, which involves asexually propagated material, the New Crops

Research Branch, Crops Research Division, was requested by the National Coordinating Committee for the New Crops to assume leadership in making a survey of the clonal material being maintained in this country. It was decided to undertake the tree fruits and nuts first. A questionnaire was prepared on 5" x 8" file cards in the format shown on page 4. The initial distribution of questionnaires was made to State Experiment stations through the Regional Plant Introduction Stations in October 1959. Other Federal stations were contacted direct by the Branch.

This present compilation is a survey rather than an inventory since it was not intended that this work be exhaustive. There are many institutional, commercial and private plant collections scattered throughout the country that probably contain clones not to be found at any of the locations contacted in this survey. To have solicited inventories from each of these would have involved work disproportionate to the basic purpose of the survey.

The first tabulation of questionnaires returned to Branch headquarters at Beltsville, Md., was made in May 1961. An analysis showed that of the 8,660 items reported 44.6 percent were apples, 30 percent were stone fruits, 15.6 percent were pears, 4.5 percent were nuts, and 5.3 percent were miscellaneous items.

As a result of this preliminary analysis, it was decided to publish the survey of deciduous fruits and nuts in three parts: I. Apples, II. Stone Fruits, III. Pears, Nuts, and Other Fruits. Other surveys will be assembled covering (1) vegetables, and (2) forage and turf, in order of priority established by the National Coordinating Committee.

In this publication the clonal material of stone fruits being maintained at Federal and State Experiment stations is tabulated in the same fashion as were the apples in the previous survey.

Since the category of stone fruits is quite diversified, grouping is somewhat difficult and is at best arbitrary. Recent investigations show that some fruits that have long been generally considered to belong in one class more properly belong in another class. *Prunus tomentosa* Thunb., commonly called Manchu cherry (Nanking c.) illustrates this point. It is more susceptible to the viruses of plums than to those of cherries and is genetically more compatible with plums than with cherries. It is therefore grouped with the plums rather than with the cherries in this work.

Certain interspecific hybrids that have recently been made, add to the complexity of how to catalog the stone fruits. Some

of the progeny of such crosses are sufficiently stable and different from either parent to warrant creating new categories, e.g. plum x apricot is called plumcot. The Duke cherry, P. x gondouinii (Poit. & Turpin) Rehd., was derived from the interspecific cross P. cerasus X P. avium.

The cherries are listed alphabetically without regard as to whether they be considered sweet, sour, or in combination. Similarly, nectarines are interspersed alphabetically among the peaches.

The term prune is generally applied to a fruit that has a favorable drying ratio. Conversely, the term plum is used when referring to the fruit of this type that is more commonly consumed fresh or is wet-processed. Some varieties such as Italian Prune, Demaris, and Stanley are consumed fresh, dried, canned, and as jam. Therefore, no attempt is made to distinguish between plums and prunes in this work.

The information obtained from the questionnaires was edited for botanical names and Plant Introduction numbers were assigned for each entry where applicable. Common names were edited insofar as reliable references are available. Some descriptive information obtained by a search of literature and correspondence was added by the author.

A limited amount of material listed herein has been indexed for certain viruses. This material is designated by an asterisk (*) after the station code where it is to be found.

It should be understood that the listing of any item in this survey does not guarantee that the item will be available from the indicated source in the future.

The key to the reporting stations and the abbreviations used in the descriptions appear on pages 5, 6, and 7.

Minnesota

The aim of the apricot breeding program at the University of Minnesota Fruit Breeding Farm was to develop hardy varieties with high quality fruit adaptable to the North Central States. Of the 28 selections reported, 19 are being maintained at the U.S.Horticultural Field Station, Cheyenne, Wyoming. North Dakota State University and South Dakota State University reported five and three selections respectively. The University of Minnesota reported the following descriptive information.

Minn. #7		AES,Excelsior,Minn.	Superb X Manchu 22.Hardiness doubtful in Minn.V.gd.processing.Fr.med.lge.,fair qual., crks.badly.		MnS

North Dakota

Like the apricot breeding program in Minnesota selections at the North Dakota Experiment Station were made for hardiness and fruit quality for the severe conditions in the North Central States. Of the 30 selections reported, three were made from variety crosses, 22 were selections from open pollinated seedlings of *P. mandshurica*, and 5 of *P. siberica*.

Minnesota

The cherry breeding program at the Minnesota Station was conducted with an objective of developing hardy, home garden fruit for the North Central States. Some of the 26 selections reported are the results of crosses between commercial sour cherry varieties and pin cherry. Others are selections from seedlings grown from Norwegian seed and *P. japonica* seed. Many of the selections were bush type. The fruit is generally small, of variable color and in cases clingstone. None of the selections has reached varietal status.

New York

The Experiment Station at Prosser, Washington reported nine Geneva selections. Eight are sweet cherries and one Mahaleb - all marked "good seed source". Seven other Geneva selections of sweet cherries were reported by the Oregon Station and two by Vermont. Of these last selections numbers 591, 1507, and 1519 are described in the catalog of the N. Y. State Fruit Testing Cooperative Association.

North Dakota

The cherry breeding program at the Northern Great Plains Field Station, Mandan, has as its objective hardiness and drought resistance of sour cherries and other *Prunus* species for that region. Named varieties developed from this program are reported elsewhere in their respective alphabetical order. With the exception of one selection reported by the Cheyenne Station, none of the 69 selections were reported by other than the Mandan Station where they originated. Information as to whether any of these selections were approaching varietal status was not available to the author at the time of this writing.

Oregon, Washington, Wyoming

The 49 unnamed cherry selections reported by these stations are mostly rootstock. The 4 Mazzard and 14 Mahaleb selections reported by Washington have been virus indexed. The notes indicated that each of them might be a good seed source for index hosts. No comments were reported for the remaining items.

Texas					

The work with peaches at the Texas Station is largely toward the development of varieties with low chilling requirements. Six selections from the cross Burbank July Elberta X (Stark Early Elberta X Floriberta) were reported, one of which was judged to be worthy of varietal status. The others are valued as breeding lines for low chilling requirements.

Thirty-five selections from the cross Rofloriberta X Flaming Gold were reported as being of value only in breeding for low chilling requirements. None of the latter cross is reported as being of commercial value. The fruit of each line is rated on a scale from 1 to 10 for shape, color, appearance, firmness, freestone, and quality.

INTERSPECIFIC HYBRIDS

In listing the hybrids in this section some of the names were found to be too cumbersome to fit into the "Variety" column. In these cases additional information appears in the comments column.

For the convenience of the readers who are interested, the genetic composition of named cultivars is listed immediately below.

Compass - P. besseyi X P. hortulana var. mineri

Elliot - P. salicina X P. americana

Manitou - P. tenella X P. persica var. nectarina

Monarch - P. domestica

St. Anthony - P. besseyi X P. salicina

Sapa - P. besseyi X P. salicina

Scout - P. sibirica

Tom Thumb - P. besseyi X P. domestica

Zumbra - (P. avium X P. pensylvanica) X P. besseyi

Species	PI No.	Received From	Reported Comments	Station No.	Reporting Sta.
